

# **Computational Linguistics Lab: WordNet**

**Elena Cabrio, FBK-Irst**

mail: [cabrio@fbk.eu](mailto:cabrio@fbk.eu)

# Outline:

---

- ▶ Word sense identification basing on WordNet
  - ▶ Exercise of text annotation
- ▶ Compute semantic relatedness using lexical resources
  - ▶ WordNet::Similarity
- ▶ Reading group: discussion of the paper
  - ▶ Ponzetto, S. P. Strube, M. ***Knowledge Derived From Wikipedia For Computing Semantic Relatedness***

# Word sense identification using WordNet

---

- ▶ Let's try to annotate a sample of text using WordNet synsets!
- ▶ Steps:
  - ▶ Identify the lemma of the content words
  - ▶ Look up into WordNet online  
(<http://wordnetweb.princeton.edu/perl/webwn>)
  - ▶ Disambiguate the sense of the word, given the context in which it appears
  - ▶ Annotate the word with the correct sense id
- ▶ Directory Lab4\_exercise
  - ▶ plain\_text.txt (sample of the Brown Corpus)
  - ▶ sample\_to\_annotate.txt

<s snum=29> The Protestants themselves are the first to admit the great falling off in effective membership in their churches. </s>

**PLAIN TEXT**

<s snum=29>

**SAMPLE TO ANNOTATE**

<wf cmd=ignore pos=DT>The</wf>

<wf cmd=done pos=NN lemma=? wnsn=? lexsns=? >Protestants</wf>

<wf cmd=ignore pos=PRP>themselves</wf>

<wf cmd=done pos=VB lemma= wnsn= lexsns= >are</wf>

...

<s snum=29> The Protestants themselves are the first to admit the great falling off in effective membership in their churches. </s>

**PLAIN TEXT**

<s snum=29>  
<wf cmd=ignore pos=DT>The</wf>  
<wf cmd=done pos=NN lemma=protestant wnsn=? lexs=? >Protestants</wf>  
<wf cmd=ignore pos=PRP>themselves</wf>  
<wf cmd=done pos=VB lemma= wnsn= lexs= >re</wf>  
...

**SAMPLE TO ANNOTATE**

WordNet Search - 3.0 - [WordNet home page](#) - [Glossary](#) - [Help](#)

Word to search for:

Display Options: (Select option to change)

[WordNet home page](#)

- (Select option to change)
- Hide Example Sentences
- Hide Glosses

WordNet Search - 3.0 - [WordNet home page](#) - [Glossary](#) - [Help](#)

Word to search for:

Display Options:

Key: "S:" = Show Synset (semantic) relations, "W:" = Show Word (lexical) relations

### Noun

- [S:](#) (n) [Protestant#1](#) (protestant%1:18:00::) (an adherent of Protestantism)
- [S:](#) (n) [Protestant Church#1](#) (protestant church%1:14:00::), [Protestant#2](#) (protestant%1:14:00::) (the Protestant churches and denominations collectively)

### Adjective

- [S:](#) (adj) [Protestant#1](#) (protestant%3:01:00::) (of or relating to Protestants or Protestantism) "*Protestant churches*"; "*a Protestant denomination*"
- [S:](#) (adj) [protestant#2](#) (protestant%3:00:00:complaining:00) (protesting)

<s snum=29> The Protestants themselves are the first to admit the great falling off in effective membership in their churches. </s>

**PLAIN TEXT**

<s snum=29>

<wf cmd=ignore pos=DT>The</wf>

<wf cmd=done pos=NN lemma=protestant wnsn=1 lexs=1:18:00:: >Protestants</wf>

<wf cmd=ignore pos=PRP>themselves</wf>

<wf cmd=done pos=VB lemma= wnsn= lexs= >are</wf>

...

## SAMPLE TO ANNOTATE

WordNet Search - 3.0 - [WordNet home page](#) - [Glossary](#) - [Help](#)

Word to search for:

Display Options:

Key: "S:" = Show Synset (semantic) relations, "W:" = Show Word (lexical) relations

### Noun

- [S:](#) (n) [Protestant#1](#) (protestant%1:18:00::) (an adherent of Protestantism)
- [S:](#) (n) [Protestant Church#1](#) (protestant church%1:14:00::), [Protestant#2](#) (protestant%1:14:00::) (the Protestant churches and denominations collectively)

### Adjective

- [S:](#) (adj) [Protestant#1](#) (protestant%3:01:00::) (of or relating to Protestants or Protestantism) "*Protestant churches*"; "*a Protestant denomination*"
- [S:](#) (adj) [protestant#2](#) (protestant%3:00:00:complaining:00) (protesting)

# Evaluate your annotation

---

- ▶ Directory Lab4\_exercise

- ▶ goldstandard.txt (SemCor, sample of Brown Corpus annotated with WN synsets)

- ▶ scorer.pl: to evaluate the accuracy of your work

- ▶ From the command line:

- ```
perl scorer.pl sample_to_annotate.txt goldstandard.txt
```

Challenge for NLP systems: SENSEVAL

# Semantic similarity measures

---

- ▶ The need to determine the semantic distance between two lexical expressed concepts is a problem that pervades the Computational Linguistics
- ▶ The problem has a long history in philosophy, psychology, artificial intelligence, ...

 The perspective of semantic relatedness of two lexemes in a lexical resource

# Word sense identification using WordNet

---

- ▶ In the CL literature, many terms are used by different authors: semantic relatedness, similarity, semantic distance, ...
- ▶ Resnik (1995): “car and gasoline seem more closely related than car and bicycles, even if the second pairs are more similar”
- ▶ Morris and Hirst (2004): relatedness covers various kinds of relations: meronymy, antonymy, functional association, and other non-classical relations. E.g. antonyms are dissimilar and hence distant, but strongly related

# Semantic distance in a lexical resource

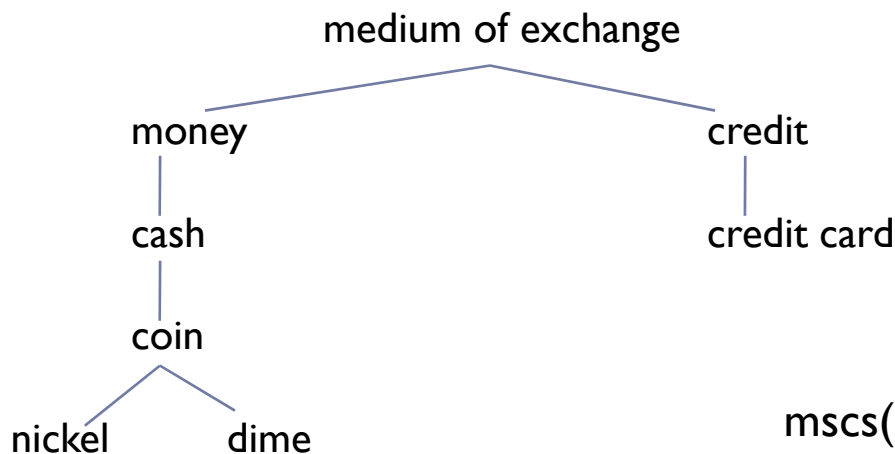

---

- ▶ **concept:** a particular sense of a given word
- ▶ we are not talking about similarity of distributional behavior of words (e.g. Dagan, 2000)
- ▶ when we refer to hierarchies and networks of concepts, we use the term **link** (or **edge**) to refer the relationships between nodes
- ▶ Approaches using WVN are focused on noun hierarchy:
  - ▶ The backbone of noun hierarchy is the IS-A relation
  - ▶ At the top of the hierarchy are 11 abstract concepts (unique beginners)
  - ▶ The maximum depth is 16 nodes
  - ▶ Beyond IS-A, also other relations: Part-of, Substance-of, ...

# WordNet approaches: terminology

---

- ▶ The length of the **shortest path** from synset  $c_i$  to  $c_j$  (measured in edges) is denoted by  **$len(c_i, c_j)$**
- ▶ The **depth of a node** is the length from the node to the global root  **$depth(c_i) = len(root, c_i)$**
- ▶  **$mscs(c_i, c_j)$**  is the most specific common subsumer of  $c_i$  and  $c_j$

$mscs(nickel, dime) = coin$

$mscs(nickel, credit\_card) = medium\_of\_exchange$

# WordNet:: similarity

---

- ▶ <http://marimba.d.umn.edu/cgi-bin/similarity/similarity.cgi>

Read an overview of [WordNet::Similarity](#).

You may enter any two words in one of three formats:

1. word
2. word#part\_of\_speech (where part\_of\_speech is one of n, v, a, or r)
3. word#part\_of\_speech#sense (where sense is a positive integer)

If words are entered in format 1 or 2, then the relatedness of all valid forms of the words will be computed (e.g., if 'dogs' is entered, then 'dog' will be used to compute relatedness). [More instructions](#).

Word 1:  ☒ Use all senses ☐ Pick a sense by [gloss](#) ☐ Pick a sense by [synset](#)

Word 2:  ☒ Use all senses ☐ Pick a sense by [gloss](#) ☐ Pick a sense by [synset](#)

Measure:  [About the measures](#)

☒ Use [root node](#)?
