#### M.S. Course "Artificial Intelligence Systems", academic year 2022-2023

Last update: Friday 9th September, 2022, 15:57

Copyright notice: Most examples and images displayed in the slides of this course are taken from [Russell & Norvig, "Artificial Intelligence, a Modern Approach", 3<sup>rd</sup> ed., Pearson], including explicitly figures from the above-mentioned book, so that their copyright is detained by the authors. A few other material (text, figures, examples) is authored by (in alphabetical order): Pieter Abbeel, Bonnie J. Dorr, Anca Dragan, Dan Klein, Nikita Kitaev, Tom Lenaerts, Michela Milano, Dana Nau, Maria Simi, who detain its copyright. These slides cannot can be displayed in public without the permission of the author.

### Outline

Al: Fiction vs. Reality

### What is AI?

Soundations and History of AI

### Outline

### Al: Fiction vs. Reality

### What is AI?

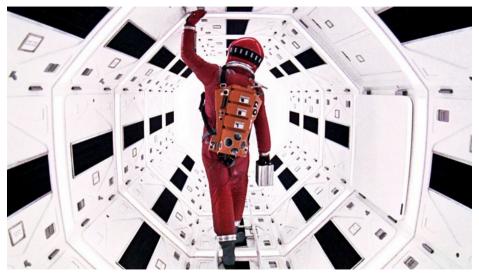

Foundations and History of AI

There is plenty of AI in fiction ...

### "Metropolis", 1927, by Fritz Lang

"2001, Space Odyssey", 1968, by Stanley Kubrick

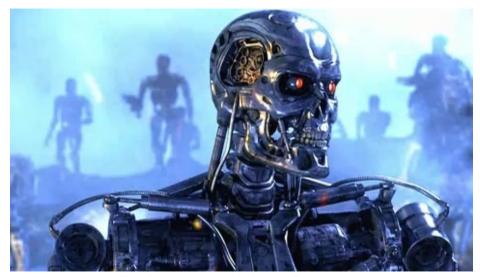

æ

"Star Wars", 1977, by George Lucas

### "Blade Runner", 1982, by Ridley Scott

"Terminator", 1984, by James Cameron

(ロ) (四) (注) (注) (注) (注)

"A.I., Artificial Intelligence", 2001, by Steven Spielberg

"I, Robot", 2004, by Alex Proyas

### "Wall-E", 2008, by Andrew Stanton

"Ex Machina", 2015, by Alex Garland

æ

イロン 不良 とくほど 不良と

"Blade Runner, 2049", 2017, by Denis Villeneuve

B > < B > - B

... and many others ...

(see, e.g., https://www.looper.com/198685/the-stunning-evolution-of-ai-in-movies/) Many AI fantasies from fiction are becoming reality ...

### ... self-driving cars, ...

э

... autonomous vacuum cleaners, ...

### ... soccer-playing robots, ...

©Sony

.. acrobatic humanoid robots, ...

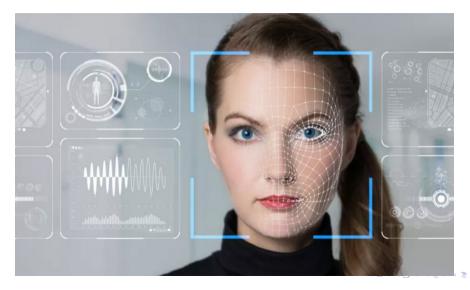

### ... autonomous trading bots, ...

### ..., vocal assistants, ...

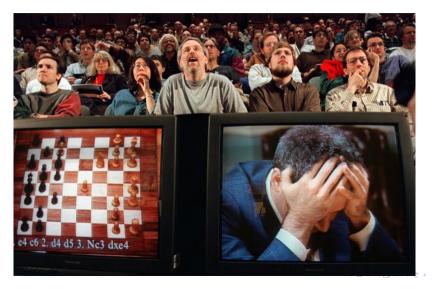

... image/face recognition tools, ...

7/39

... world-champion beating chess players, ...

... world-champion beating go players, ...

クへで 7/39

### ... Al fighter pilots, ...

... and many others ...

#### Intelligence

### For thousands of years, we have tried to understand how we think:

- how can a "handful of matter" perceive, understand, predict, and manipulate a world far larger and more complicated than itself?
- involves many disciplines, including logic, psychology, cognitive science, neuroscience, philosophy, ethics, linguistics, ...

### Artificial Intelligence

- it attempts not just to understand, but also to build intelligent entities
- involves all the above disciplines, but also mathematics, computer science, engineering, economics, control theory & cybernetics, electronics, ...

#### Intelligence

For thousands of years, we have tried to understand how we think:

Intelligence (from Wikipedia)

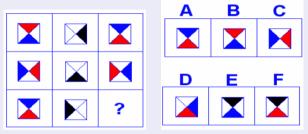

"Intelligence has been defined in many ways: the capacity for logic, understanding, self-awareness, learning, emotional knowledge, reasoning, planning, creativity, critical thinking, and problem-solving.

More generally, it can be described as the ability to perceive or infer information, and to retain it as knowledge to be applied towards adaptive behaviors within an environment or context. (...)" Intelligence (from Wikipedia)

More generally, it can be described as the ability to perceive or infer information, and to retain it as knowledge to be applied towards adaptive behaviors within an environment or context. (...)"

### Example: simple puzzle

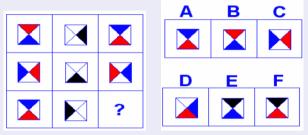

(Courtesy of Michela Milano, UniBO)

### • What is the solution of this puzzle?

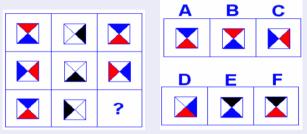

- $\Rightarrow$  (I'd say) B: result of column-by-column clockwise rotation
- What have you done for solving it?
  - $\blacksquare$  read & recognize figures  $\Longrightarrow$  perceive information.
  - recognize patterns, problem and candidate solutions.
    - $\implies$  retain knowledge
  - ) choose solution  $\Longrightarrow$  infer other knowledge

### Example: simple puzzle

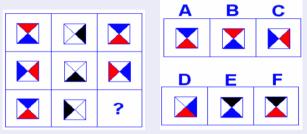

- What is the solution of this puzzle?
  - ⇒ (I'd say) B: result of column-by-column clockwise rotation
- What have you done for solving it?
  - $\blacksquare$  read & recognize figures  $\Longrightarrow$  perceive information
  - recognize patterns, problem and candidate solutions.
    - $\implies$  retain knowledge
  - ) choose solution  $\Longrightarrow$  infer other knowledge

### Example: simple puzzle

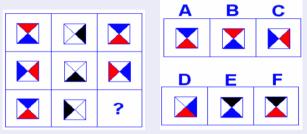

- What is the solution of this puzzle?
  - ⇒ (I'd say) B: result of column-by-column clockwise rotation
- What have you done for solving it?
  - **1** read & recognize figures  $\implies$  perceive information
  - recognize patterns, problem and candidate solutions
    - $\implies$  retain knowledge
  - Interpretation (Interpretation)  $\Rightarrow$  infer other knowledge

### Example: simple puzzle

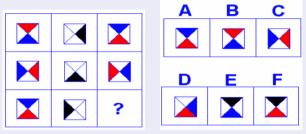

- What is the solution of this puzzle?
  - ⇒ (I'd say) B: result of column-by-column clockwise rotation
- What have you done for solving it?
  - **()** read & recognize figures  $\implies$  perceive information
    - recognize patterns, problem and candidate solutions
      - $\implies$  retain knowledge
  - Interprete solution  $\implies$  infer other knowledge

### Example: simple puzzle

- What is the solution of this puzzle?
  - ⇒ (I'd say) B: result of column-by-column clockwise rotation
- What have you done for solving it?
  - $\bigcirc$  read & recognize figures  $\implies$  perceive information
  - Precognize patterns, problem and candidate solutions
    - $\implies$  retain knowledge
  - ) choose solution  $\Longrightarrow$  infer other knowledge

### Example: simple puzzle

- What is the solution of this puzzle?
  - ⇒ (I'd say) B: result of column-by-column clockwise rotation
- What have you done for solving it?
  - $\bigcirc$  read & recognize figures  $\implies$  perceive information
  - Precognize patterns, problem and candidate solutions
    - $\implies$  retain knowledge
  - Schoose solution  $\implies$  infer other knowledge

#### Different definitions due to different criteria

Historically, four approaches, along two orthogonal dimensions:

• thought processes & reasoning

VS

behavior & action

• Success according to human standards

VS.

success according to an ideal concept of intelligence: rationality.

- human-centered approach: involves observations and hypotheses about human behavior
- rationalist approach involves a combination of mathematics and engineering.

#### Different definitions due to different criteria

Historically, four approaches, along two orthogonal dimensions:

• thought processes & reasoning

#### vs. behavior & action

- Success according to human standards
  - VS.

success according to an ideal concept of intelligence: rationality.

# What is Artificial Intelligence? [cont.]

Thinking Humanly	Thinking Rationally
"The exciting new effort to make comput- ers think <i>machines with minds</i> , in the full and literal sense." (Haugeland, 1985)	"The study of mental faculties through the use of computational models." (Charniak and McDermott, 1985)
"[The automation of] activities that we associate with human thinking, activities such as decision-making, problem solv-ing, learning" (Bellman, 1978)	"The study of the computations that make it possible to perceive, reason, and act." (Winston, 1992)
Acting Humanly	Acting Rationally
"The art of creating machines that per- form functions that require intelligence when performed by people." (Kurzweil, 1990)	"Computational Intelligence is the study of the design of intelligent agents." (Poole <i>et al.</i> , 1998)
"The study of how to make computers do things at which, at the moment, people are better." (Rich and Knight, 1991)	"AI is concerned with intelligent behavior in artifacts." (Nilsson, 1998)

### Problem: How do humans think?

- Idea: develop a theory of the mind
- $\Rightarrow$  express the theory as computer programs
  - e.g. Newell & Simon's General Problem Solver (1961)
  - Requires scientific theories of brain activities (cognitive model)
  - Inter-disciplinary field: Cognitive Science
    - combines computer models from AI and experimental techniques from psychology
    - construct precise and testable theories of the human mind
  - Al and Cognitive Science nowadays distinct
    - A.I: find an algorithm performing well on a task
    - C.S: find a good model of human performance

#### Problem: How do humans think?

- Idea: develop a theory of the mind
- $\implies$  express the theory as computer programs
  - e.g. Newell & Simon's General Problem Solver (1961)
  - Requires scientific theories of brain activities (cognitive model)

### Problem: When does a system behave intelligently?

- Alan Turing "Computing Machinery and Intelligence" (1950)
- Operational test of intelligence (aka "The Imitation game"):
  - A human, a computer, an interrogator in a different room.
  - The Interrogator should classify the human and the machine.
  - Gran, their composition includence, their incomposition world have observableed one as Increases?
- "behave intelligently" \leftarrow "behave humanly"

Problem: When does a system behave intelligently?

- Alan Turing "Computing Machinery and Intelligence" (1950)
- Operational test of intelligence (aka "The Imitation game"):
  - A human, a computer, an interrogator in a different room.
  - The interrogator should classify the human and the machine.
  - Can the computer mislead the interrogator and be classified as a human?
- "behave intelligently"  $\iff$  "behave humanly"

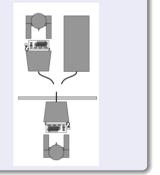

Problem: When does a system behave intelligently?

- "behave intelligently"  $\iff$  "behave humanly"

### Capabilities for passing the Turing Test

### • natural language processing to enable it to communicate successfully in English (or other)

- knowledge representation to store what it knows or hears
- automated reasoning to answer questions and to draw new conclusions
- machine learning to adapt to new circumstances and to detect and extrapolate patterns

For Total Turing test (with physical interaction wrt. interrogator):

- computer vision to perceive objects
- computer speech to communicate orally
- robotics to manipulate objects and move about
- These disciplines compose most of AI
- Turing Test is still relevant in AI (although not fundamental)

#### Some successes with Turing test

- (2014) a chatbot by Eugene Goostman, mimicking the answer of a 13 years old boy, has succeeded the test.
  - chatbots are now frequently available
- vocal assistants are now of common use
  - e.g. Alexa (Amazon), Siri (Apple), Cortana (Microsoft), ...

### Limitations of Turing Test

- not reproducible, constructive or amenable to mathematical analysis
- Al researchers devoted little effort to make systems pass the Turing Test
- [ Do humans always pass the Turing test? (See e.g. <u>here</u>) ]
- Should we really emulate humans to achieve intelligence?
- Shouldn't we study the underlying principles of intelligence instead?

### Metaphorical Example

Successful flight machines have not been developed by imitating birds, rather by studying engines and aerodynamics.

(see e.g. this video).

### Problem: Can we capture the laws of thought?

• Aristotle: What are correct argument and thought processes?

- codify "right thinking" i.e. irrefutable reasoning processes (syllogisms): (e.g. "all men are mortal; Socrates is a man; therefore, Socrates is mortal")
- $\Rightarrow$  Logic and Logical inference
- The Logicist tradition in AI hopes to create intelligent systems using logic-based inference systems
  - "algorithm = logic + control"
  - logic programming, automated-deduction systems, ...
  - logics: propositional, first-order, modal & decription, temporal, ...
- Two main limitations:
  - not easy to state informal knowledge into the formal terms of logic
  - problems undecidable or computationally very hard (NP-hard)
- Logical reasoning is currently part of many fields of Al
  - problem solving, knowledge representation & reasoning, planning,
  - does not exhaustively cover AI

Problem: Can we capture the laws of thought?

## Problem: Can we make systems "do the right thing"?

- An agent is an entity that perceives and acts
  - persists over a prolonged time period
- A rational agent acts so as
  - o to achieve the best outcome (maximize goal achievement), or
  - to addeve the best expected outcome (under uncertainty)
- Rational agents need all skills needed for the Turing Test!
- Thinking rationally is sometimes part of being a rational agent
  - e.g. planning an action.
  - sometimes action without thinking (e.g. reflexes)
- Two advantages over previous approaches:
  - More general than law of thoughts approach (correct Inference is just one of several possible mechanisms for schleving rationality)
  - More encouble to adentific development then burnen-emulation approaches (rationality mathematically well defined & general)

## Problem: Can we make systems "do the right thing"?

  - More general than law of thoughts approach (correct inference is just one of several possible mechanisms for achieving rationality)
  - More amenable to scientific development than human-emulation approaches (rationality mathematically well defined & general)

Problem: Can we make systems "do the right thing"?

- An agent is an entity that perceives and acts
  - persists over a prolonged time period
- A rational agent acts so as
  - to achieve the best outcome (maximize goal achievement), or
  - to achieve the best expected outcome (under uncertainty)
- Rational agents need all skills needed for the Turing Test!
- Thinking rationally is sometimes part of being a rational agent
  - e.g. planning an action
  - sometimes action without thinking (e.g. reflexes)
- Two advantages over previous approaches:
  - More general than law of thoughts approach (correct inference is just one of several possible mechanisms for achieving rationality)
  - More amenable to scientific development than human-emulation approaches (rationality mathematically well defined & general)

This course concentrates on general principles of rational agents and on the components for constructing them. (Following AIMA book.)

#### Remark

- achieving perfect rationality is not feasible in complex environments
  - computational demands too high
  - however, good working hypothesis and starting point for analysis
- $\Rightarrow$  dealing with limited rationality
  - acting appropriately when not enough time to do all computations

This course concentrates on general principles of rational agents and on the components for constructing them. (Following AIMA book.)

#### Remark

  - computational demands too high
  - however, good working hypothesis and starting point for analysis
- $\Rightarrow$  dealing with limited rationality
  - acting appropriately when not enough time to do all computations

#### Weak vs. Strong AI

- Weak AI: Is it possible to build systems that act as if they were intelligent?
- Strong AI: Is it possible to build systems that are intelligent? (i.e., that have conscious minds, wills and sentiments?)

- General AI refers to systems able to cope with any generalized task which is asked of it, much like a human.
- Narrow AI refers to systems able to handle one particular task.
   AI system displays a certain degree of intelligence only in a particular narrow field to perform highly specialized tasks

### Weak vs. Strong AI

- Weak AI: Is it possible to build systems that act as if they were intelligent?
- Strong AI: Is it possible to build systems that are intelligent? (i.e., that have conscious minds, wills and sentiments?)

- General AI refers to systems able to cope with any generalized task which is asked of it, much like a human.

# AI Systems Classification [cont.]

#### Symbolic Approach vs. Connectionist Approach

- Top-down, or Symbolic Approach:
  - Symbolic representation of knowledge
  - Logics, ontologies, rule based systems, declarative architecture
  - Human-understandable models
- Bottom up, or Connectionist Approach:
  - Based on Neural networks.
  - Knowledge is not symbolic and it is "encoded" into connections between neurons.
  - Concepts are learned by examples
  - Non understandable by humans

# AI Systems Classification [cont.]

Symbolic Approach vs. Connectionist Approach

- Top-down, or Symbolic Approach:

#### The Gestation of AI (1943-1955)

- 1943: Warren Mc Culloch and Walter Pitts: a model of artificial Boolean neurons to perform computations
  - First steps toward connectionist computation and learning
  - Marvin Minsky and Dann Edmonds (1951) constructed the first neural network computer
- 1950: Alan Turing: "Computing Machinery and Intelligence"
  - Turing Test
  - First complete vision of AI

### The Birth of AI (1956) and Era of Great Expectations

- Darmouth Workshop (1956) brought together top minds on automata theory, neural nets and the study of intelligence
  - Allen Newell and Herbert Simon: The Logic Theorist
    - first nonnumerical thinking program used for theorem proving
    - proved theorems from Russel&Whitehead Principia Mathematica
- The era of great expectations (1952-1969)
  - Newell and Simon introduced the General Problem Solver (GPS)
    - could handle a (limited) number of logical puzzles
    - imitation of human problem-solving: strategy to address subgoals
    - Idea: any system (human or machine) exhibiting intelligence must operate by manipulating data structures composed of symbols
  - John McCarthy
    - Invented LISP (and time-sharing)
    - Logic-oriented Advice Taker, decoupling knowledge and reasoning
  - Marvin Minsky
    - addressed microworlds, problems in limited domain that appear to require intelligence to solve (e.g. blocks-world, geometric problems)
  - S. Winograd and J.D. Cowan, et al.: early work on neural networks

#### Collapse in AI research (1966 - 1973)

- Progress was slower than expected.
  - enthusiast predictions turned unrealistic
- Some systems lacked scalability
  - computational intractability due to combinatorial explosion in search
- Fundamental limitations on techniques and representations
  - Minsky&Papert (1969): important limitations to neural networks

Al Revival via knowledge-based systems (1969-1970)

- General-purpose ⇒ domain specific systems
  - narrow domains, exploiting domain-specific knowledge
  - E.g. DENDRAL: successful in inferring molecular structure from information by mass-spectrometer (Buchanan et al. 1969)
- Expert systems applied to areas of human expertise
  - e.g., MYCIN: diagnose blood infections (Feigenbaum et al.)
  - based on 450 domain-specific rules from experts & textbooks
  - a calculus for uncertainty
- Several progresses in Natural language processing
  - incorporate domain knowledge in NLP

#### Al becomes an industry (1980-present)

- commercial expert system R1 at DEC (McDermott, 1982)
  - helped configure orders for computer system (saves: 40M\$/year)
- followed a period of national and industry investments in AI
- followed a period of expert systems industry busts ("AI Winter")

Al Revival via knowledge-based systems (1969-1970)

- General-purpose ⇒ domain specific systems
  - narrow domains, exploiting domain-specific knowledge
  - E.g. DENDRAL: successful in inferring molecular structure from information by mass-spectrometer (Buchanan et al. 1969)
- Expert systems applied to areas of human expertise
  - e.g., MYCIN: diagnose blood infections (Feigenbaum et al.)
  - based on 450 domain-specific rules from experts & textbooks
  - a calculus for uncertainty
- Several progresses in Natural language processing
  - incorporate domain knowledge in NLP

### AI becomes an industry (1980-present)

- commercial expert system R1 at DEC (McDermott, 1982)
  - helped configure orders for computer system (saves: 40M\$/year)
- followed a period of national and industry investments in AI
- followed a period of expert systems industry busts ("AI Winter")

#### The return of neural networks (1986-present)

- (re)invented the back-propagation learning algorithm
  - applied to many learning problems in computer science and psychology
- revival of connectionist models for intelligent systems (vs. symbolic or logicist approaches)

#### Al adopts the scientific method (1987-present)

- A "gentle revolution" in AI content and methodology
  - build on existing theories than to propose brand-new ones
  - base claims on rigorous theorems or hard experimental evidence rather than on intuition
  - show relevance to real-world applications rather than toy example
- AI has finally come firmly under the scientific method
  - hypotheses must be subjected to rigorous empirical experiment
  - results must be analyzed statistically for their importance
  - $\implies$  general increase in technical depth
- Resurgence of probability, focus on uncertainty
  - (speech & handwriting recognition): hidden Markov models
  - neural networks benefited from statistics, pattern recognition, and machine learning mining
  - rigorous reasoning with uncertainty: Baynesian networks
  - Similar "gentle revolutions" occurred in robotics, computer vision, and knowledge representation.

#### The emergence of intelligent agents (1995-present)

• renewed interest in the "whole agent" problem:

"How does an agent act/behave embedded in real environments with continuous sensory inputs?"

- Es: AI in the internet domain "-bots"
  - Decision support systems, robotic agents, natural language
- Need for interaction between sensing and reasoning
  - $\implies$  reasoning and planning systems must handle uncertainty
- Al forced into much closer contact with other fields
  - e.g. control theory, economics

The availability of very large data sets (2001-present)

Big data and massive computing power (e.g. GPUs) have enabled deep networks to be properly trained and to work properly

- Until recently: emphasis on algorithms
- Recent works in AI: emphasis on data (for machine learning & deep learning)
- ⇒ learning methods rather than hand-coded knowledge engineering used to express the knowledge a system needs
  - Large amount and variety of AI applications (speech and image recognition, spam filtering, robotics, machine translation, autonomous vehicles, game playing, ...)
  - many AI applications are now deeply embedded in the infrastructure of every industry

#### The Deep-Learning Tsunami (2015-present)

- "Deep Learning waves have lapped at the shores of computational linguistics for several years now, but 2015 seems like the year when the full force of the tsunami hit the major Natural Language Processing (NLP) conferences." [C. Manning]
- Previous successes in the fields of image classification and speech...
- Experts in the field (LeCun, Hinton, Bengio) agree on the fact that there will be important developments in text and video understanding, machine translation, question answering ... [Turing award]
- Google masters GO: Deep-learning software defeats human professional for the first time. AlphaGo. Nature 529, 445-446 (28 January 2016). In March 2016, Lee Sedol defeated.
