# Planning Problem

## Planning Problem

Given  $\langle I, G, T \rangle$ , where

- ▶ **I**: (representation of) initial state
- ▶ **G**: (representation of) goal state
- ▶ **T**: transition relation

find a sequence of transitions  $t_1, \dots, t_n$  leading from the initial state to the goal state.

## Idea

Encode planning problem as a model checking problem, such that plan is provided as counter-example for the property.

1. impose **I** as initial state
2. encode **T** as transition relation system
3. verify the LTL property **!** (**F goal state**)

# Example: blocks [1/9]

*Init* :  $On(A, B), On(B, C), On(C, T), Clear(A)$

*Goal* :  $On(C, B), On(B, A), On(A, T)$

*Move*( $a, b, c$ )

*Precond* :  $Block(a) \wedge Clear(a) \wedge On(a, b) \wedge$   
 $(Clear(c) \vee Table(c)) \wedge$

$a \neq b \wedge a \neq c \wedge b \neq c$

*Effect* :  $Clear(b) \wedge \neg On(a, b) \wedge$

$On(a, c) \wedge \neg Clear(c)$

## 1. Planning problem

# Example: blocks [2/9]

---

```
MODULE block(id, ab, bl)
VAR
  above : {none, a, b, c}; -- the block above this one
  below : {none, a, b, c}; -- the block below this one
DEFINE
  clear := (above = none);
INIT
  above = ab &
  below = bl
-- a block can't be above or below itself
INVAR below != id & above != id

MODULE main
VAR
  -- at each step only one block moves
  move : {move_a, move_b, move_c};
  block_a : block(a, none, b);
  block_b : block(b, a, c);
  block_c : block(c, b, none);
  ...
```

# Example: blocks [3/9]

---

- ▶ a moving block changes location and remains clear

TRANS

```
(move = move_a -> next(block_a.clear) &  
                    next(block_a.below) != block_a.below) &  
(move = move_b -> next(block_b.clear) &  
                    next(block_b.below) != block_b.below) &  
(move = move_c -> next(block_c.clear) &  
                    next(block_c.below) != block_c.below)
```

- ▶ a non-moving block does not change its location

TRANS

```
(move != move_a -> next(block_a.below) = block_a.below) &  
(move != move_b -> next(block_b.below) = block_b.below) &  
(move != move_c -> next(block_c.below) = block_c.below)
```

# Example: blocks [4/9]

---

- ▶ a block remains connected to any non-moving block

TRANS

```
(move != move_a & block_b.above = a
  -> next(block_b.above) = a) &
(move != move_a & block_c.above = a
  -> next(block_c.above) = a) &
(move != move_b & block_a.above = b
  -> next(block_a.above) = b) &
(move != move_b & block_c.above = b
  -> next(block_c.above) = b) &
(move != move_c & block_a.above = c
  -> next(block_a.above) = c) &
(move != move_c & block_b.above = c
  -> next(block_b.above) = c)
```

# Example: blocks [4/9]

---

- ▶ a block remains connected to any non-moving block

TRANS

```
(move != move_a & block_b.above = a
  -> next(block_b.above) = a) &
(move != move_a & block_c.above = a
  -> next(block_c.above) = a) &
(move != move_b & block_a.above = b
  -> next(block_a.above) = b) &
(move != move_b & block_c.above = b
  -> next(block_c.above) = b) &
(move != move_c & block_a.above = c
  -> next(block_a.above) = c) &
(move != move_c & block_b.above = c
  -> next(block_b.above) = c)
```

- ▶ Q: what about “below block”?

# Example: blocks [4/9]

---

- ▶ a block remains connected to any non-moving block

TRANS

```
(move != move_a & block_b.above = a
  -> next(block_b.above) = a) &
(move != move_a & block_c.above = a
  -> next(block_c.above) = a) &
(move != move_b & block_a.above = b
  -> next(block_a.above) = b) &
(move != move_b & block_c.above = b
  -> next(block_c.above) = b) &
(move != move_c & block_a.above = c
  -> next(block_a.above) = c) &
(move != move_c & block_b.above = c
  -> next(block_b.above) = c)
```

- ▶ **Q: what about "below block"?**  
**A: covered in previous slide!**

# Example: blocks [5/9]

- ▶ positioning of blocks is symmetric: above and below relations must be symmetric.

INVAR

```
(block_a.above = b <-> block_b.below = a)
& (block_a.above = c <-> block_c.below = a)
& (block_b.above = a <-> block_a.below = b)
& (block_b.above = c <-> block_c.below = b)
& (block_c.above = a <-> block_a.below = c)
& (block_c.above = b <-> block_b.below = c)

& (block_a.above = none ->
    (block_b.below != a & block_c.below != a))
& (block_b.above = none ->
    (block_a.below != b & block_c.below != b))
& (block_c.above = none ->
    (block_a.below != c & block_b.below != c))

& (block_a.below = none ->
    (block_b.above != a & block_c.above != a))
& (block_b.below = none ->
    (block_a.above != b & block_c.above != b))
& (block_c.below = none ->
    (block_a.above != c & block_b.above != c))
```

## 1. Planning problem

## Example: blocks [6/9]

---

- ▶ a block cannot move if it has some other block above itself

...

TRANS

```
(!next(block_a.clear) -> next(move) != move_a) &
```

```
(!next(block_b.clear) -> next(move) != move_b) &
```

```
(!next(block_c.clear) -> next(move) != move_c)
```

...

# Example: blocks [6/9]

- ▶ a block cannot move if it has some other block above itself

...

TRANS

```
(!next(block_a.clear) -> next(move) != move_a) &
(!next(block_b.clear) -> next(move) != move_b) &
(!next(block_c.clear) -> next(move) != move_c)
```

...

- ▶ **Q:** what's wrong with following formulation?

...

TRANS

```
(next(block_a.clear) -> next(move) = move_a) &
(next(block_b.clear) -> next(move) = move_b) &
(next(block_c.clear) -> next(move) = move_c)
```

...

# Example: blocks [6/9]

- ▶ a block cannot move if it has some other block above itself

...

TRANS

```
(!next(block_a.clear) -> next(move) != move_a) &
(!next(block_b.clear) -> next(move) != move_b) &
(!next(block_c.clear) -> next(move) != move_c)
```

...

- ▶ **Q:** what's wrong with following formulation?

...

TRANS

```
(next(block_a.clear) -> next(move) = move_a) &
(next(block_b.clear) -> next(move) = move_b) &
(next(block_c.clear) -> next(move) = move_c)
```

...

**A:**

- ▶ move can only have **one** valid value  $\implies$  **inconsistency** whenever there are two clear blocks at the same time
- ▶ any non-clear block would still be able to move
- ▶ same for "iff" formulation

# Example: blocks [7/9]

---

## Remark

A **plan** is a sequence of transitions/actions leading from the initial state to an accepting/goal state.

## Idea

- ▶ assert property  $p$ : “goal state is not reachable”
- ▶ if a plan **exists**, nuXmv produces a counterexample for  $p$
- ▶ the counterexample for  $p$  is a plan to reach the goal

## Examples

- ▶ get a plan for reaching “goal state”

LTLSPEC

```
! F(block_a.below = none & block_a.above = b &  
  block_b.below = a & block_b.above = c &  
  block_c.below = b & block_c.above = none)
```

# Example: blocks [8/9]

---

## Examples

- ▶ get a plan for reaching “goal state”

LTLSPEC

```
! F(block_a.below = none & block_a.above = b &  
  block_b.below = a & block_b.above = c &  
  block_c.below = b & block_c.above = none)
```

- ▶ get a plan for reaching a configuration in which all blocks are placed on the table

```
LTLSPEC -- look for a way to reach a configuration in which all the blocks  
  -- the table
```

```
! F(block_a.below = none & block_b.below = none & block_c.below = none)
```

# Example: blocks [9/9]

---

- ▶ at any given time, at least one block is placed on the table

INVARSPEC

```
block_a.below = none | block_b.below = none |
```

```
block_c.below = none
```

# Example: blocks [9/9]

---

- ▶ at any given time, at least one block is placed on the table

INVARSPEC

```
block_a.below = none | block_b.below = none |  
block_c.below = none
```

- ▶ at any given time, at least one block has nothing above

INVARSPEC

```
block_a.above = none | block_b.above = none |  
block_c.above = none
```

# Outline

## Tower of Hanoi

Extend the tower of hanoi to handle five disks, and check that the goal state is reachable.

# Exercises [2/3]

---

## Ferryman

Another ferryman has to bring a fox, a chicken, a caterpillar and a crop of lettuce safely across a river.

- ▶ **initial state:** all goods are on the right side
- ▶ **goal state:** all goods are on the left side
- ▶ **rules:**
  - ▶ the ferryman can cross the river with at most **two** passengers on his boat
  - ▶ the fox eats the chicken if left unattended on the same side of the river
  - ▶ the chicken eats the caterpillar if left unattended on the same side of the river
  - ▶ the caterpillar eats the lettuce if left unattended on the same side of the river

Can the ferryman bring every item safely on the other side?

# Exercises [3/3]

---

## Sudoku

Encode in an SMV model the game of Sudoku, write a property so that nuXmv finds the solution.

You can find the rules on Wikipedia.

## Tip

Use a MODULE to avoid repetitions of the same constraints.  
220 lines are enough.
