# Infinite Word Languages

### Modeling infinite computations of reactive systems

Given an Alphabet  $\Sigma$  (e.g.  $\Sigma \stackrel{\text{def}}{=} \{a, b\}$ )

• An  $\omega$ -word  $\alpha$  over  $\Sigma$  is an infinite sequence

 $a_0, a_1, a_2 \dots$ 

Formally,  $\alpha : \mathbb{N} \to \Sigma$ .

- The set of all infinite words is denoted by  $\Sigma^{\omega}$ .
- A  $\omega$ -language L is collection of  $\omega$ -words, i.e.  $L \subseteq \Sigma^{\omega}$ .
- Example: All words over  $\{a, b\}$  with infinitely many a's.

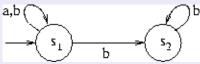

#### Notation:

omega words  $\alpha, \beta, \gamma \in \Sigma^{\omega}$ . omega-languages  $L, L_1 \subseteq \Sigma^{\omega}$ 

For  $u \in \Sigma^+$ , let  $u^{\omega} = u.u.u...$ 

# Omega-Automata

We consider automaton running over infinite words.

• Let  $\alpha = aabbbb...$ There are several (infinite) possible runs.

Run 
$$\rho_1 = s_1, s_1, s_1, s_1, s_2, s_2 \dots$$
  
Run  $\rho_2 = s_1, s_1, s_1, s_1, s_1, s_1 \dots$ 

- Acceptance Conditions: Büchi (Muller, Rabin, Street):
   Acceptance is based on states occurring infinitely often
- Notation Let  $\rho \in Q^{\omega}$ . Then,  $Inf(\rho) = \{s \in Q \mid \exists^{\infty}i \in \mathbb{N}. \ \rho(i) = s\}.$  (The set of states occurring infinitely many times in  $\rho$ .)

### Büchi Automata

#### Nondeterministic Büchi Automaton

- A Nondeterministic Büchi Automaton (NBA) is  $(Q, \Sigma, \delta, I, F)$  s.t.
- Q Finite set of states.
  - Σ is a finite alphabet
  - $I \subseteq Q$  set of initial states.
  - $F \subseteq Q$  set of accepting states.
    - $\delta \subseteq Q \times \Sigma \times Q$  transition relation (edges).
- A Deterministic Büchi Automaton (DBA) is an NBA s.t. the transition relation is functional:  $\delta: Q \times \Sigma \longmapsto Q$

### Runs and Language of NBAs

• A run  $\rho$  of A on  $\omega$ -word  $\alpha = a_0, a_1, a_2, ...$  is an infinite sequence

$$\rho = q_0, q_1, q_2, \dots$$
 s.t.  $q_0 \in I$  and  $q_i \stackrel{a_i}{\longrightarrow} q_{i+1}$  for  $0 \le i$ .

• The run  $\rho$  is accepting if

$$Inf(\rho) \cap F \neq \emptyset$$
.

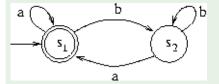

• The language accepted by A

$$\mathcal{L}(A) = \{ \alpha \in \Sigma^{\omega} \mid A \text{ has an accepting run on } \alpha \}$$

# Büchi Automaton: Example

Let  $\Sigma = \{a, b\}$ .

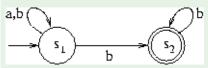

Let a Deterministic Büchi Automaton (DBA) A<sub>1</sub> be

- With  $F = \{s_1\}$  the automaton recognizes words with infinitely many a's.
- With  $F = \{s_2\}$  the automaton recognizes words with infinitely many b's.

# Büchi Automaton: Example (2)

Let a Nondeterministic Büchi Automaton (NBA) A2 be

With  $F = \{s_2\}$ , the automaton  $A_2$  recognizes words with finitely many a. Thus,  $\mathcal{L}(A_2) = \overline{\mathcal{L}(A_1)}$ .

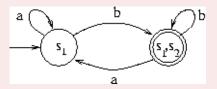

# Deterministic vs. Nondeterministic Büchi Automata

#### **Theorem**

DBAs are strictly less powerful than NBAs.

#### The subset construction does not work!

Let DA2 be

- DA<sub>2</sub> is not equivalent to A<sub>2</sub>
   (e.g., it recognizes (b.a)<sup>ω</sup>)
- There is no DBA equivalent to A2

# **Closure Properties**

#### Theorem (union, intersection)

For the NBAs  $A_1$ ,  $A_2$  we can construct

- the NBA A s.t.  $\mathcal{L}(A) = \mathcal{L}(A_1) \cup \mathcal{L}(A_2)$ .  $|A| = |A_1| + |A_2|$
- the NBA A s.t.  $\mathcal{L}(A) = \mathcal{L}(A_1) \cap \mathcal{L}(A_2)$ .  $|A| \leq |A_1| \cdot |A_2| \cdot 2$ .

### Union of two NBAs

#### Definition: union of NBAs

Let  $A_1 = (Q_1, \Sigma_1, \delta_1, I_1, F_1)$ ,  $A_2 = (Q_2, \Sigma_2, \delta_2, I_2, F_2)$ . Then  $A = A_1 \cup A_2 = (Q, \Sigma, \delta, I, F)$  is defined as follows

- $Q := Q_1 \cup Q_2$ ,  $I := I_1 \cup I_2$ ,  $F := F_1 \cup F_2$
- $R(s,s') := \left\{ \begin{array}{l} R_1(s,s') \ if \ s \in Q_1 \\ R_2(s,s') \ if \ s \in Q_2 \end{array} \right.$

#### **Theorem**

- $\bullet \ \mathcal{L}(A) = \mathcal{L}(A_1) \cup \mathcal{L}(A_2)$
- $|A| = |A_1| + |A_2|$

#### Note

A is an automaton which just runs nondeterministically either  $A_1$  or  $A_2$  (same construction as with ordinary automata)

# Synchronous Product of NBAs

### Definition: synchronous product of NBAs

Let 
$$A_1 = (Q_1, \Sigma, \delta_1, I_1, F_1)$$
 and  $A_2 = (Q_2, \Sigma, \delta_2, I_2, F_2)$ .  
Then,  $A_1 \times A_2 = (Q, \Sigma, \delta, I, F)$ , where  $Q = Q_1 \times Q_2 \times \{1, 2\}$ .  
 $I = I_1 \times I_2 \times \{1\}$ .  
 $F = F_1 \times Q_2 \times \{1\}$ .  
 $\langle p, q, 1 \rangle \xrightarrow{a} \langle p', q', 1 \rangle$  iff  $p \xrightarrow{a} p'$  and  $q \xrightarrow{a} q'$  and  $p \notin F_1$ .  
 $\langle p, q, 1 \rangle \xrightarrow{a} \langle p', q', 2 \rangle$  iff  $p \xrightarrow{a} p'$  and  $q \xrightarrow{a} q'$  and  $q \notin F_2$ .  
 $\langle p, q, 2 \rangle \xrightarrow{a} \langle p', q', 2 \rangle$  iff  $p \xrightarrow{a} p'$  and  $q \xrightarrow{a} q'$  and  $q \notin F_2$ .  
 $\langle p, q, 2 \rangle \xrightarrow{a} \langle p', q', 1 \rangle$  iff  $p \xrightarrow{a} p'$  and  $q \xrightarrow{a} q'$  and  $q \notin F_2$ .

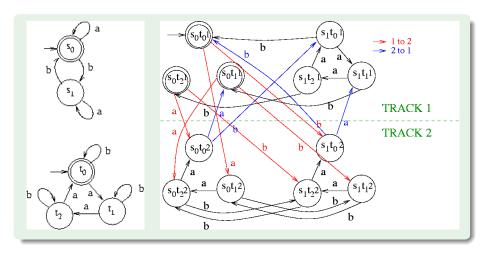

#### **Theorem**

- $\bullet \ \mathcal{L}(A_1 \times A_2) \ = \ \mathcal{L}(A_1) \cap \mathcal{L}(A_2).$
- $|A_1 \times A_2| \leq 2 \cdot |A_1| \cdot |A_2|$ .

# Synchronous Product of NBAs: Intuition

- The automaton remembers two tracks, one for each source NBA, and it points to one of the two tracks
- As soon as it goes through an accepting state of the current track, it switches to the other track
   ⇒ in order to visit infinitely often a state in F (i.e., F₁), it must visit infinitely often some state also in F₂
- Important subcase: If  $F_2 = Q_2$ , then  $Q = Q_1 \times Q_2$ .  $I = I_1 \times I_2$ .  $F = F_1 \times Q_2$ .

# Synchronous Product of NBAs: Example

# Closure Properties (2)

### Theorem (complementation) [Safra, MacNaughten]

For the NBA  $A_1$  we can construct an NBA  $A_2$  such that  $\mathcal{L}(A_2) = \overline{\mathcal{L}(A_1)}$ .  $|A_2| = O(2^{|A_1| \cdot \log(|A_1|)})$ .

### Method: (hint)

- (i) convert a Büchi automaton into a Non-Deterministic Rabin automaton
- (ii) determinize and Complement the Rabin automaton
- (iii) convert the Rabin automaton into a Büchi automaton.

# Generalized Büchi Automaton

#### Definition

- A Generalized Büchi Automaton is a tuple  $A := (Q, \Sigma, \delta, I, FT)$  where  $FT = \langle F_1, F_2, \dots, F_k \rangle$  with  $F_i \subseteq Q$ .
- A run  $\rho$  of A is accepting if  $Inf(\rho) \cap F_i \neq \emptyset$  for each  $1 \leq i \leq k$ .

#### **Theorem**

For every Generalized Büchi Automaton we can construct a language equivalent plain Büchi Automaton.

#### Intuition

Let  $Q' = Q \times \{1, \dots, K\}$ .

The automaton remains in phase i till it visits a state in  $F_i$ . Then, it moves to  $(i \mod K) + 1$  mode.

# De-generalization of a generalized NBA

### Definition: De-generalization of a generalized NBA

 $Q' = Q_1 \times \{1, ..., K\}.$ 

 $I' = I \times \{1\}.$ 

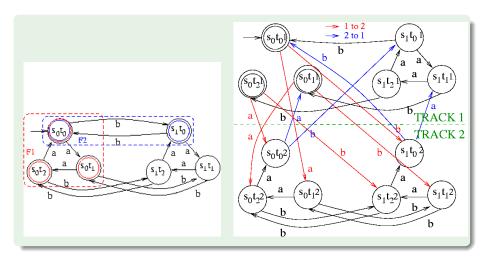

Let  $A \stackrel{\text{def}}{=} (Q, \Sigma, \delta, I, FT)$  a generalized BA s.f.  $FT \stackrel{\text{def}}{=} \{F_1, ..., F_K\}$ . Then a language-equivalent BA  $A' \stackrel{\text{def}}{=} (Q', \Sigma, \delta', I', F')$  is built as follows

$$F' = F_1 \times \{1\}.$$
  
 $\delta'$  is s.t., for every  $i \in [1, ..., K]$ :  
 $\langle p, i \rangle \xrightarrow{a} \langle q, i \rangle$  iff  $p \xrightarrow{a} q \in \delta$  and  $p \notin F_i$ .  
 $\langle p, i \rangle \xrightarrow{a} \langle q, (i \mod K) + 1 \rangle$  iff  $p \xrightarrow{a} q \in \delta$  and  $p \in F_i$ .

#### **Theorem**

- $\bullet \ \mathcal{L}(A') = \mathcal{L}(A).$
- $\bullet |A'| \leq K \cdot |A|.$

# Degeneralizing a Büchi automaton: Example

# Omega-regular Expressions

#### Definition

A language is called  $\omega$ -regular if it has the form  $\bigcup_{i=1}^n U_i \cdot (V_i)^{\omega}$  where  $U_i, V_i$  are regular languages.

#### **Theorem**

A language L is  $\omega$ -regular iff it is NBA-recognizable.

# Automata-Theoretic LTL Satisfiability and Entailment

### LTL Validity/Satisfiability

 $\bullet$  Let  $\psi$  be an LTL formula

•  $A_{\neg\psi}$  is a Büchi Automaton which represents all and only the paths that satisfy  $\neg\psi$  (do not satisfy  $\psi$ )

#### LTL Entailment

• Let  $\varphi, \psi$  be an LTL formula

$$\begin{array}{c} \varphi \models \psi \quad \text{(LTL)} \\ \models \varphi \rightarrow \psi \quad \text{(LTL)} \\ \Longleftrightarrow \varphi \land \neg \psi \text{ unsat} \\ \Longleftrightarrow \mathcal{L}(A_{\varphi \land \neg \psi}) = \emptyset \end{array}$$

•  $A_{\varphi \wedge \neg \psi}$  is a Büchi Automaton which represents all and only the paths that satisfy  $\varphi \wedge \neg \psi$  (satisfy  $\varphi$  and do not satisfy  $\psi$ )

# Automata-Theoretic LTL Model Checking

### LTL Model Checking

• Let M be a Kripke model and  $\psi$  be an LTL formula

```
\begin{array}{c}
M \models \psi \quad \text{(LTL)} \\
\iff \mathcal{L}(M) \subseteq \mathcal{L}(\psi) \\
\iff \mathcal{L}(M) \cap \overline{\mathcal{L}}(\psi) = \emptyset \\
\iff \mathcal{L}(M) \cap \mathcal{L}(\neg \psi) = \emptyset \\
\iff \mathcal{L}(A_M) \cap \mathcal{L}(A_{\neg \psi}) = \emptyset \\
\iff \mathcal{L}(A_M \times A_{\neg \psi}) = \emptyset
\end{array}
```

- A<sub>M</sub> is a Büchi Automaton equivalent to M (which represents all and only the executions of M)
- $A_{\neg \psi}$  is a Büchi Automaton which represents all and only the paths that satisfy  $\neg \psi$  (do not satisfy  $\psi$ )
- $\implies$   $A_M \times A_{\neg \psi}$  represents all and only the paths appearing in M and not in  $\psi$ .

# Automata-Theoretic LTL Model Checking

### Four steps

Let  $\varphi \stackrel{\text{def}}{=} \neg \psi$ :

- (i) Compute  $A_M$
- (ii) Compute  $A_{\varphi}$
- (iii) Compute the product  $A_M \times A_{\varphi}$
- (iv) Check the emptiness of  $\mathcal{L}(A_M \times A_{\varphi})$

# **Outline**

- Büchi Automata
- The Automata-Theoretic Approach to LTL Reasoning

  - From Kripke Models to Büchi Automata
  - From LTL Formulas to Büchi Automata
  - Complexity
- 3 Exercises

# NBA emptiness checking

- Find an accepting cycle reachable from an initial state.
- A naive algorithm:
  - (i) a DFS finds the final states *f* reachable from an initial state;
  - (ii) for each f, a second DFS finds if it can reach f(i.e., if there exists a loop)

Complexity:  $O(n^2)$ 

- SCC-based algorithm:
  - (i) Tarjan's algorithm uses a DFS to find the SCCs in linear time;
  - (ii) drop all SCCs which do not have at least one arc, and which do not contain at least one accepting state f
  - (iii) another DFS finds if the union of non-trivial SCCs is reachable from an initial state.

Complexity: O(n)

 Drawbacks: it stores too much information and does not find directly a counterexample.

# Double Nested DFS algorithm

#### **Double Nested DFS**

- Two nested DFSs
  - DFS1 finds the final states f reachable from an initial state
  - for each f, DFS2 finds if it can reach f (i.e., if there exists a loop)
- Two Hash tables:
  - T1: reachable states
  - T2: states reachable from a reachable final state
- Two stacks:
  - S1: current branch of states reachable
  - S2: current branch of states reachable from final state f
- It stops as soon as it finds a counterexample.
- The counterexample is given by
  - the stack of DFS2 (an accepting, preceded by cycle)
  - the stack of DFS1 (a path from an initial state to the cycle)
- DFS1 invokes DFS2 on each  $f_i$  only after popping it (postorder)
- T2 passed by reference, is not reset at each call of DFS2!

# Double Nested DFS - First DFS

```
// returns True if empty language, false otherwise
Bool DFS1(NBA A) {
   stack S1=I; stack S2=\emptyset;
   Hashtable T1=I; Hashtable T2=\emptyset;
   while S1!=\emptyset {
      v=top(S1);
       if \exists w \text{ s.t. } w \in \delta(v) \&\& T1(w) == 0 {
          hash(w,T1);
          push(w,S1);
       } else {
          pop(S1);
          if (v∈F && !DFS2(v,S2,T2,A))
              return False;
   return True;
```

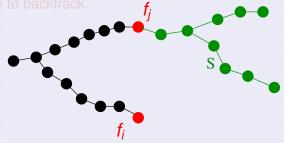

# Double Nested DFS - Second DFS

```
Bool DFS2(state f, stack & S, Hashtable & T, NBA A) |
   hash(f,T);
   S = \{f\}
   while S! = \emptyset {
       v=top(S);
       if f \in \delta(v) return False;
       if \exists w \text{ s.t. } w \in \delta(v) \&\& T(w) == 0  {
           hash(w);
           push(w);
        } else pop(S);
    return True;
```

Remark: T passed by reference, is not reset at each call of DFS2!

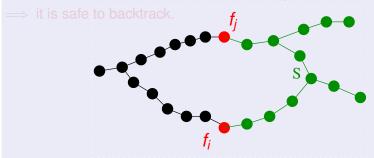

- suppose *DFS2* is invoked on  $f_i$  before than on  $f_i$
- $\implies f_i$  not reachable from (any state s which is reachable from)  $f_j$ 
  - If during  $DFS2(f_i,...)$  it is encountered a state S which has already been explored by  $DFS2(f_j,...)$  for some  $f_j$ ,
    - can we reach f<sub>i</sub> from S?
    - No, because f<sub>i</sub> is not reachable from f<sub>i</sub>!
- ⇒ it is safe to backtrack.

- suppose *DFS*2 is invoked on  $f_i$  before than on  $f_i$
- $\Rightarrow f_i$  not reachable from (any state s which is reachable from)  $f_j$
- If during  $DFS2(f_i,...)$  it is encountered a state S which has already been explored by  $DFS2(f_j,...)$  for some  $f_j$ ,
  - can we reach if from 5?
     No hecause f is not reachable f

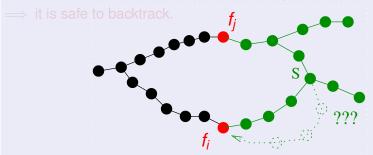

- suppose *DFS*2 is invoked on  $f_i$  before than on  $f_i$
- $\implies f_i$  not reachable from (any state s which is reachable from)  $f_j$ 
  - If during  $DFS2(f_i,...)$  it is encountered a state S which has already been explored by  $DFS2(f_j,...)$  for some  $f_j$ ,
    - No. because f: is not reachable from
- it is safe to backtrack.

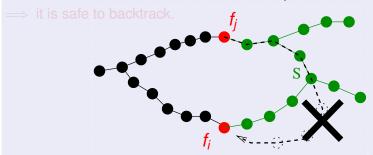

- suppose *DFS*2 is invoked on  $f_i$  before than on  $f_i$
- $\implies f_i$  not reachable from (any state s which is reachable from)  $f_j$ 
  - If during  $DFS2(f_i,...)$  it is encountered a state S which has already been explored by  $DFS2(f_j,...)$  for some  $f_j$ ,
    - can we reach  $f_i$  from S?
    - No, because  $f_i$  is not reachable from  $f_i$ !

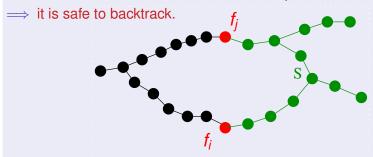

- suppose *DFS*2 is invoked on  $f_i$  before than on  $f_i$
- $\implies f_i$  not reachable from (any state s which is reachable from)  $f_j$ 
  - If during DFS2(f<sub>i</sub>,...) it is encountered a state S which has already been explored by DFS2(f<sub>j</sub>,...) for some f<sub>j</sub>,
    - can we reach  $f_i$  from S?
    - No, because  $f_i$  is not reachable from  $f_i$ !

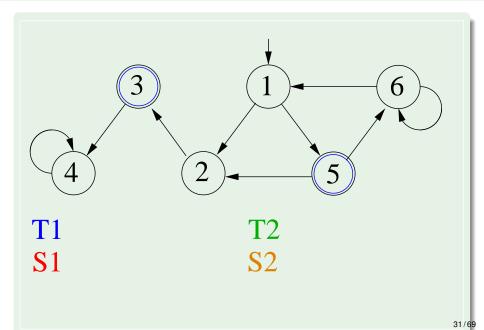

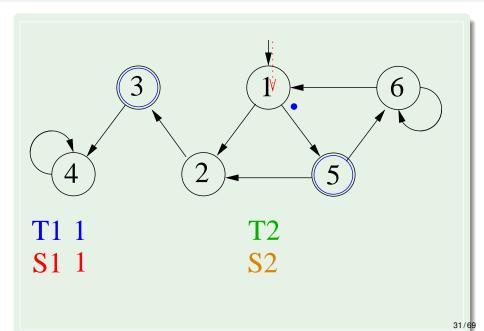

- suppose *DFS*2 is invoked on  $f_i$  before than on  $f_i$
- $\implies f_i$  not reachable from (any state s which is reachable from)  $f_j$ 
  - If during DFS2(f<sub>i</sub>,...) it is encountered a state S which has already been explored by DFS2(f<sub>j</sub>,...) for some f<sub>j</sub>,
    - can we reach  $f_i$  from S?
    - No, because  $f_i$  is not reachable from  $f_j$ !

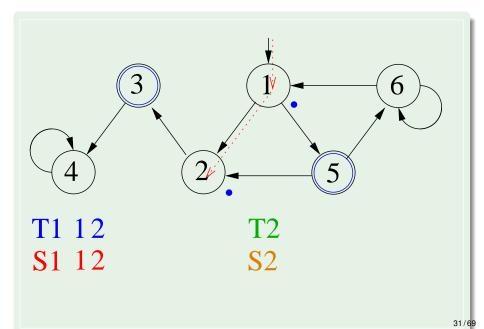

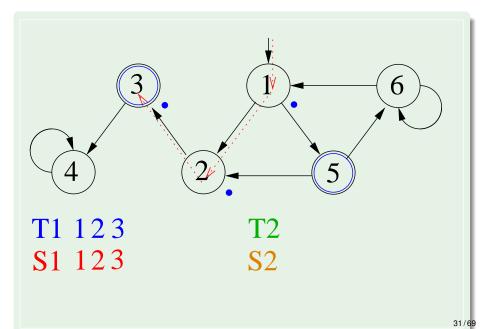

- suppose *DFS*2 is invoked on  $f_i$  before than on  $f_i$
- $\implies f_i$  not reachable from (any state s which is reachable from)  $f_j$ 
  - If during DFS2(f<sub>i</sub>,...) it is encountered a state S which has already been explored by DFS2(f<sub>j</sub>,...) for some f<sub>j</sub>,
    - can we reach  $f_i$  from S?
    - No, because  $f_i$  is not reachable from  $f_j$ !

#### Computing an NBA $A_M$ from a Kripke Structure M

- Transform a Kripke model  $M = \langle S, S_0, R, L, AP \rangle$  into an NBA  $A_M = \langle Q, \Sigma, \delta, I, F \rangle$  s.t.:
  - States:  $Q := S \cup \{init\}$ , init being a new initial state
  - Alphabet:  $\Sigma := 2^{AP}$
  - Initial State: I := {init}
  - Accepting States:  $F := Q = S \cup \{init\}$
  - Transitions:

$$\delta: q \xrightarrow{a} q' \text{ iff } (q, q') \in R \text{ and } L(q') = a$$
  
 $init \xrightarrow{a} q \text{ iff } q \in S_0 \text{ and } L(q) = a$ 

- $\mathcal{L}(A_M) = \mathcal{L}(M)$
- $|A_M| = |M| + 1$

# Computing a NBA $A_M$ from a Kripke Structure M: Example

#### Labels on Kripke Structures and BA's - Remark

Note that the labels of a Büchi Automaton are different from the labels of a Kripke Structure. Also graphically, they are interpreted differently:

- in a Kripke Structure, it means that p is true and all other propositions are false;
- in a Büchi Automaton, it means that p is true and all other propositions are irrelevant ("don't care"), i.e. they can be either true or false.

#### **Outline**

- Büchi Automata
- The Automata-Theoretic Approach to LTL Reasoning
  - General Ideas
  - Language-Emptiness Checking of Büchi Automata
  - From Kripke Models to Büchi Automata
  - From LTL Formulas to Büchi Automata
  - Complexity
- 3 Exercises

#### Translation problem

#### **Problem**

Given an LTL formula  $\phi$ , find a Büchi Automaton that accepts the same language of  $\phi$ .

- It is a fundamental problem in LTL model checking (in other words, every model checking algorithm that verifies the correctness of an LTL formula translates it in some sort of finite-state machine).
- We will translate an LTL formula into a Generalized Büchi Automata (GBA).

#### LTL Negative Normal Form (NNF)

- Every LTL formula  $\varphi$  can be written into an equivalent formula  $\varphi'$  using only the operators  $\wedge$ ,  $\vee$ ,  $\mathbf{X}$ ,  $\mathbf{U}$ ,  $\mathbf{R}$  on propositional literals.
- Done by pushing negations down to literal level:

```
\begin{array}{lll}
\neg(\varphi_1 \lor \varphi_2) & \Longrightarrow & (\neg \varphi_1 \land \neg \varphi_2) \\
\neg(\varphi_1 \land \varphi_2) & \Longrightarrow & (\neg \varphi_1 \lor \neg \varphi_2) \\
\neg \mathbf{X}\varphi_1 & \Longrightarrow & \mathbf{X}\neg \varphi_1 \\
\neg(\varphi_1 \mathbf{U}\varphi_2) & \Longrightarrow & (\neg \varphi_1 \mathbf{R}\neg \varphi_2) \\
\neg(\phi_1 \mathbf{R}\phi_2) & \Longrightarrow & (\neg \phi_1 \mathbf{U} \neg \phi_2)
\end{array}
```

- $\Longrightarrow$  the resulting formula is expressed in terms of  $\lor$ ,  $\land$ , X, U, R and literals (Negative Normal Form, NNF).
  - encoding linear if a DAG representation is used
- In the construction of  $A_{\varphi}$  we now assume that  $\varphi$  is in NNF.
- For convenience, we still use F's and G's as shortcuts:  $\mathbf{F}\varphi$  for  $\top\mathbf{U}\varphi$  and  $\mathbf{G}\varphi$  for  $\bot\mathbf{R}\varphi$

Apply recursively the following steps:

```
Step 1: Apply the tableau expansion rules to \varphi \psi_1 \mathbf{U} \psi_2 \Longrightarrow \psi_2 \vee (\psi_1 \wedge \mathbf{X}(\psi_1 \mathbf{U} \psi_2)) [and \mathbf{F} \psi \Longrightarrow \psi \vee \mathbf{X} \mathbf{F} \psi] \psi_1 \mathbf{R} \psi_2 \Longrightarrow \psi_2 \wedge (\psi_1 \vee \mathbf{X}(\psi_1 \mathbf{R} \psi_2)) [and \mathbf{G} \psi \Longrightarrow \psi \wedge \mathbf{X} \mathbf{G} \psi] until we get a Boolean combination of elementary subformulas of \varphi (An elementary formula is a proposition or a \mathbf{X}-formula.)
```

#### Tableaux Rules: a Quote

"After all... tomorrow is another day." [Scarlett O'Hara, "Gone with the Wind"]

**Step 2**: Convert all formulas into Disjunctive Normal Form, and then push the conjunctions inside the next:

$$\varphi \implies \bigvee_i (\bigwedge_j I_{ij} \wedge \bigwedge_k \mathbf{X} \psi_{ik}) \implies \bigvee_i (\bigwedge_j I_{ij} \wedge \mathbf{X} \bigwedge_k \psi_{ik}).$$

• Each disjunct  $(\bigwedge_{j} I_{ij} \wedge \mathbf{X} \bigwedge_{k} \psi_{ik})$  represents a state:

labels next part

- the conjunction of literals \(\lambda\_i \limit\_{ij}\) represents a set of labels in Σ (e.g., if  $Vars(\varphi) = \{p, q, r\}, p \land \neg q \text{ represents the two labels}$  $\{p, \neg q, r\}$  and  $\{p, \neg q, \neg r\}$ )
- $X \bigwedge_k \psi_{ik}$  represents the next part of the state (obbligations for the successors)
- N.B., if no next part occurs, XT is implicitly assumed

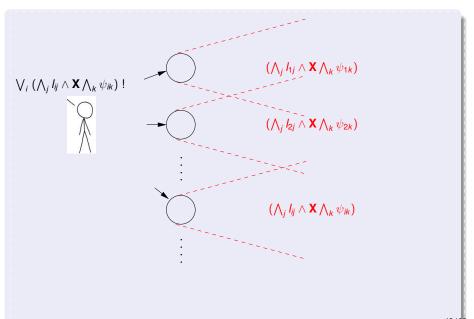

## **Step 3**: For every state $S_i$ represented by $(\bigwedge_j I_{ij} \wedge \mathbf{X} \bigwedge \psi_{ik})$

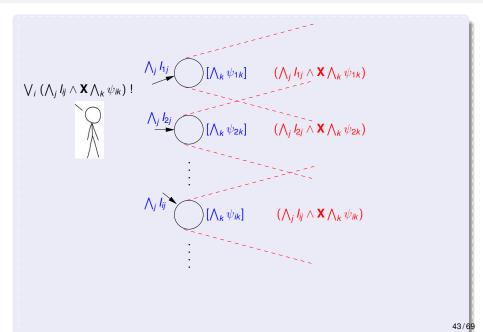

- label the incoming edges of  $S_i$  with  $\bigwedge_i I_{ij}$
- mark that the state  $S_i$  satisfies  $\varphi$
- apply recursively steps 1-2-3 to  $\varphi_i \stackrel{\text{def}}{=} \bigwedge_k \psi_{ik}$ ,

  - rewrite  $\varphi_i$  into  $\bigvee_{i'} (\bigwedge_j I'_{i'j} \wedge \mathbf{X} \bigwedge_k \psi'_{i'k})$  from each disjunct  $(\bigwedge_j I'_{i'j} \wedge \mathbf{X} \bigwedge_k \psi'_{i'k})$  generate a new state  $S_{ii'}$  (if not already present) and label it as satisfying  $\varphi_i \stackrel{\text{def}}{=} \bigwedge_{\mathbf{k}} \psi_{i\mathbf{k}}$
- draw an edge from  $S_i$  to all states  $S_{ii'}$  which satisfy  $\bigwedge_{k} \psi_{ik}$
- (if no next part occurs, X⊤ is implicitly assumed, so that an edge to a "true" node is drawn)

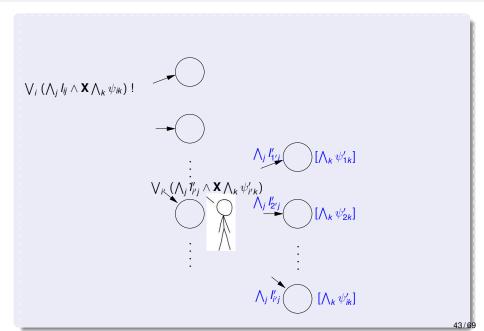

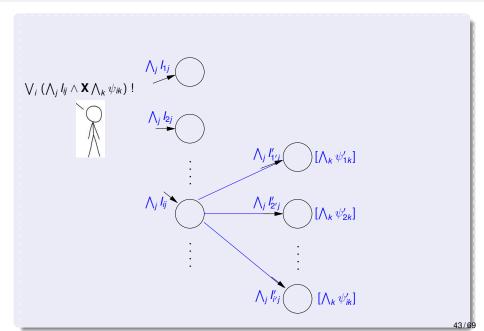

When the recursive applications of steps 1-3 has terminated and the automata graph has been built, then apply the following:

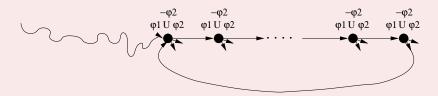

**Step 4**: For every  $\psi_i \mathbf{U} \varphi_i$ , for every state  $q_j$ , mark  $q_j$  with  $F_i$  iff  $(\psi_i \mathbf{U} \varphi_i) \notin q_j$  or  $\varphi_i \in q_j$  (If there is no **U**-subformulas, then mark all states with  $F_1$ —i.e.,  $FT \stackrel{\text{def}}{=} \{Q\}$ ).

#### Remark

The fact that we initially converted the formula into NNF guarantees that only positive **U/F**-subformulas and negative **R-/G**-subformulas are considered here

## Dealing with **U**-subformulas: Intuition

- Tableaux rules:  $\varphi_1 \mathbf{U} \varphi_2 \iff (\varphi_2 \vee (\varphi_1 \wedge \mathbf{X} \varphi_1 \mathbf{U} \varphi_2))$  are a property, not a definition of  $\mathbf{U}$ :  $\implies$  they implicitly admit a "weaker" semantics of  $\varphi_1 \mathbf{U} \varphi_2$ , in which  $\varphi_1 \mathbf{U} \varphi_2$  always holds and  $\varphi_2$  never holds
- It cannot happen that we get into a state s' from which we can enter a path  $\pi'$  in which  $\varphi_1 \mathbf{U} \varphi_2$  holds forever and  $\varphi_2$  never holds.

- $\implies$  every legal path must touch infinitely often a state where  $\neg(\varphi_1 \mathbf{U} \varphi_2) \lor \varphi_2)$  holds
  - In LTL:  $GF(\neg(\varphi_1 U \varphi_2) \lor \varphi_2)$  ("avoid bad loop")

### On-the-fly Construction of $A_{\phi}$ - State

- Henceforth, a state is represented by a tuple  $s := \langle \lambda, \chi, \sigma \rangle$  where:
  - $\lambda$  is the set of labels
  - $\chi$  is the next part, i.e. the set of X-formulas satisfied by s
  - $\sigma$  is the set of the subformulas of  $\phi$  satisfied by s (necessary for the fairness definition)
- Given a set of LTL formulas  $\Psi \stackrel{\text{def}}{=} \{\psi_1, ..., \psi_k\}$ , we define  $Cover(\Psi) \stackrel{\text{def}}{=} Expand(\Psi, \langle \emptyset, \emptyset, \emptyset \rangle)$  to be the set of initial states of the Buchi automaton representing  $\bigwedge_i \psi_i$ .
  - Combines steps 1. and 2. of previous slides
  - Expand() defined recursively as follows

## On-the-fly Construction of $A_{\phi}$ - Expand

Given a set of formulas  $\Phi$  to expand and a state s, we define the set of states  $Expand(\Phi, s)$  recursively as follows:

- if  $\Phi = \emptyset$ ,  $Expand(\Phi, s) = \{s\}$
- if  $\bot \in \Phi$ ,  $Expand(\Phi, s) = \emptyset$
- if  $\top \in \Phi$  and  $s = \langle \lambda, \chi, \sigma \rangle$ ,  $Expand(\Phi, s) = Expand(\Phi \setminus \{\top\}, \langle \lambda, \chi, \sigma \cup \{\top\} \rangle)$
- if  $I \in \Phi$  and  $s = \langle \lambda, \chi, \sigma \rangle$ , I propositional literal  $Expand(\Phi, s) = Expand(\Phi \setminus \{I\}, \langle \lambda \cup \{I\}, \chi, \sigma \cup \{I\} \rangle)$  (add I to the labels of s and to set of satisfied formulas)
- if  $\mathbf{X}\psi \in \Phi$  and  $\mathbf{s} = \langle \lambda, \chi, \sigma \rangle$ ,  $Expand(\Phi, \mathbf{s}) = Expand(\Phi \setminus \{X\psi\}, \langle \lambda, \chi \cup \{\psi\}, \sigma \cup \{X\psi\}\rangle)$ (add  $\psi$  to the next part of  $\mathbf{s}$  and  $\mathbf{X}\psi$  to set of satisfied formulas)
- if  $\psi_1 \wedge \psi_2 \in \Phi$  and  $s = \langle \lambda, \chi, \sigma \rangle$ ,  $Expand(\Phi, s) =$   $Expand(\Phi \cup \{\psi_1, \psi_2\} \setminus \{\psi_1 \wedge \psi_2\}, \langle \lambda, \chi, \sigma \cup \{\psi_1 \wedge \psi_2\} \rangle)$ (process both  $\psi_1$  and  $\psi_2$  and add  $\psi_1 \wedge \psi_2$  to  $\sigma$ )

### On-the-fly Construction of $A_{\phi}$ - Expand

- if  $\psi_1 \lor \psi_2 \in \Phi$  and  $s = \langle \lambda, \chi, \sigma \rangle$ ,  $Expand(\Phi, s) = Expand(\Phi \cup \{\psi_1\} \setminus \{\psi_1 \lor \psi_2\}, \langle \lambda, \chi, \sigma \cup \{\psi_1 \lor \psi_2\} \rangle)$   $\cup Expand(\Phi \cup \{\psi_2\} \setminus \{\psi_1 \lor \psi_2\}, \langle \lambda, \chi, \sigma \cup \{\psi_1 \lor \psi_2\} \rangle)$ (split s in two copies, process  $\psi_2$  on the first,  $\psi_1$  on the second, add  $\psi_1 \lor \psi_2$  to  $\sigma$ )
- if  $\psi_1 \mathbf{U} \psi_2 \in \Phi$  and  $s = \langle \lambda, \chi, \sigma \rangle$ ,  $Expand(\Phi, s) = Expand(\Phi \cup \{\psi_1\} \setminus \{\psi_1 \mathbf{U} \psi_2\}, \langle \lambda, \chi \cup \{\psi_1 \mathbf{U} \psi_2\}, \sigma \cup \{\psi_1 \mathbf{U} \psi_2\} \rangle)$   $\cup Expand(\Phi \cup \{\psi_2\} \setminus \{\psi_1 \mathbf{U} \psi_2\}, \langle \lambda, \chi, \sigma \cup \{\psi_1 \mathbf{U} \psi_2\} \rangle)$ (split s in two copies and process  $\psi_1$  on the first,  $\psi_2$  on the second, add  $\psi_1 \mathbf{U} \psi_2$  to  $\sigma$ )
- if  $\psi_1 \mathbf{R} \psi_2 \in \Phi$  and  $s = \langle \lambda, \chi, \sigma \rangle$ ,  $Expand(\Phi, s) = Expand(\Phi \cup \{\psi_2\} \setminus \{\psi_1 \mathbf{R} \psi_2\}, \langle \lambda, \chi \cup \{\psi_1 \mathbf{R} \psi_2\}, \sigma \cup \{\psi_1 \mathbf{R} \psi_2\} \rangle)$   $\cup Expand(\Phi \cup \{\psi_1, \psi_2\} \setminus \{\psi_1 \mathbf{R} \psi_2\}, \langle \lambda, \chi, \sigma \cup \{\psi_1 \mathbf{R} \psi_2\} \rangle)$ (split s in two copies and process  $\psi_1$  on the first,  $\psi_2$  on the second, add  $\psi_1 \mathbf{R} \psi_2$  to  $\sigma$ )

## On-the-fly Construction of $A_{\phi}$ - Expand

```
Two relevant subcases: \mathbf{F}\psi \stackrel{\text{def}}{=} \top \mathbf{U}\psi and \mathbf{G}\psi \stackrel{\text{def}}{=} \bot \mathbf{R}\psi

• if \mathbf{F}\psi \in \Phi and s = \langle \lambda, \chi, \sigma \rangle,

Expand(\Phi, s) = Expand(\Phi \setminus \{\mathbf{F}\psi\}, \langle \lambda, \chi \cup \{\mathbf{F}\psi\}, \sigma \cup \{\mathbf{F}\psi\} \rangle)

• if \mathbf{G}\psi \in \Phi and s = \langle \lambda, \chi, \sigma \rangle,

Expand(\Phi, s) = Expand(\Phi \cup \{\psi\} \setminus \{\mathbf{G}\psi\}, \langle \lambda, \chi \cup \{\mathbf{G}\psi\}, \sigma \cup \{\mathbf{G}\psi\} \rangle)

Note: Expand(\Phi \cup \{\bot, \psi\} \setminus \{\mathbf{G}\psi\}, ...) = \emptyset
```

### Definition of $A_{\phi}$

Given a set of LTL formulas  $\Psi$ , we define

$$Cover(\Psi) \stackrel{\text{def}}{=} Expand(\Psi, \langle \emptyset, \emptyset, \emptyset \rangle).$$

For an LTL formula  $\phi$ , we construct a Generalized NBA

$$A_{\phi} = (Q, \Sigma, \delta, I, FT)$$
 as follows:

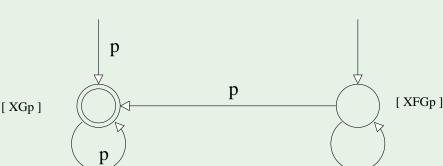

- $\Sigma = 3^{vars(\phi)} (v \in \{\top, \bot, *\})$
- Q is the smallest set such that
  - $Cover(\{\phi\}) \subseteq Q$
  - if  $\langle \lambda, \chi, \sigma \rangle \in Q$ , then  $Cover(\chi) \in Q$
- $Q_0 = Cover(\{\phi\}).$
- $s \xrightarrow{\lambda'} s' \in \delta$  iff,  $s = \langle \lambda, \chi, \sigma \rangle$ ,  $s' = \langle \lambda', \chi', \sigma' \rangle$  and  $s' \in Cover(\chi)$
- $FT = \langle F_1, F_2, ..., F_k \rangle$  where, for all  $(\psi_i \mathbf{U} \phi_i)$  occurring positively in  $\phi, F_i = \{\langle \lambda, \chi, \sigma \rangle \in Q \mid (\psi_i \mathbf{U} \phi_i) \notin \sigma \text{ or } \phi_i \in \sigma \}$ . (If there is no  $\mathbf{U}$ -subformulas, then  $FT \stackrel{\text{def}}{=} \{Q\}$ ).

## Example: $\phi = \mathbf{FG}p$

```
Cover({FGp})
        = Expand(\{\mathbf{FGp}\}, \langle \emptyset, \emptyset, \emptyset \rangle)
        = Expand(\emptyset, \langle \emptyset, \{FGp\}, \{FGp\} \rangle) \cup Expand(\{Gp\}, \langle \emptyset, \emptyset, \{FGp\} \rangle)
        = \{\langle \emptyset, \{\mathsf{FGp}\}, \{\mathsf{FGp}\}\rangle\} \cup \mathsf{Expand}(\{p\}, \langle \emptyset, \{\mathsf{Gp}\}, \{\mathsf{FGp}, \mathsf{Gp}\}\rangle)
        = \{\langle \emptyset, \{\mathsf{FGp}\}, \{\mathsf{FGp}\}\rangle\} \cup Expand(\emptyset, \langle \{p\}, \{\mathsf{Gp}\}, \{\mathsf{FGp}, \mathsf{Gp}, p\}\rangle)\}
        = \{\langle \emptyset, \{\mathsf{FG}p\}, \{\mathsf{FG}p\} \rangle, \langle \{p\}, \{\mathsf{G}p\}, \{\mathsf{FG}p, \mathsf{G}p, p\} \rangle \}
• Cover(\{\mathbf{Gp}\}) = Expand(\{\mathbf{Gp}\}, \langle \emptyset, \emptyset, \emptyset \rangle)
                                             = Expand(\{p\}, \langle \emptyset, \{\mathbf{G}p\}, \{\mathbf{G}p\} \rangle)
                                             = Expand(\emptyset, \langle \{p\}, \{\mathbf{G}p\}, \{\mathbf{G}p, p\} \rangle)
                                             = \{\langle \{p\}, \{\mathbf{G}p\}, \{\mathbf{G}p, p\}\rangle\}
Optimization:
     merge \langle \{p\}, \{\mathbf{G}p\}, \{\mathbf{F}\mathbf{G}p, \mathbf{G}p, p\} \rangle and \langle \{p\}, \{\mathbf{G}p\}, \{\mathbf{G}p, p\} \rangle
```

# Example: $\phi = \mathbf{FG}p$

- Call  $s_1 = \langle \emptyset, \{ \mathbf{FG} \rho \}, \{ \mathbf{FG} \rho \} \rangle$ ,  $s_2 = \langle \{ \rho \}, \{ \mathbf{G} \rho \}, \{ \mathbf{FG} \rho, \mathbf{G} \rho, \rho \} \rangle$
- $Q = \{s_1, s_2\}$
- $Q_0 = \{s_1, s_2\}.$ •  $T: s_1 \to \{s_1, s_2\},$
- $\begin{array}{c} \bullet \quad I: \quad s_1 \rightarrow \{s_1, s_2\} \\ s_2 \rightarrow \{s_2\} \end{array}$
- $FT = \langle F_1 \rangle$  where  $F_1 = \{s_2\}$ .

## Example: $\phi = p\mathbf{U}q$

```
\begin{array}{l} \bullet \\ \textit{Cover}(\{p \textbf{U}q\}) \\ = \textit{Expand}(\{p \textbf{U}q\}, \langle \emptyset, \emptyset, \emptyset \rangle) \\ = \textit{Expand}(\{p\}, \langle \emptyset, \{p \textbf{U}q\}, \{p \textbf{U}q\} \rangle) \cup \textit{Expand}(\{q\}, \langle \emptyset, \emptyset, \{p \textbf{U}q\} \rangle) \\ = \textit{Expand}(\emptyset, \langle \{p\}, \{p \textbf{U}q\}, \{p \textbf{U}q, p\} \rangle) \cup \textit{Expand}(\emptyset, \langle \{q\}, \emptyset, \{p \textbf{U}q, q\} \rangle) \\ = \{\langle \{p\}, \{p \textbf{U}q\}, \{p \textbf{U}q, p\} \rangle\} \cup \{\langle \{q\}, \{\top\}, \{p \textbf{U}q, q\} \rangle\} \\ \bullet \quad \textit{Cover}(\{\top\}) = \quad \{\langle \emptyset, \{\top\}, \{\top\} \rangle\} \end{array}
```

# Example: $\phi = pUq$

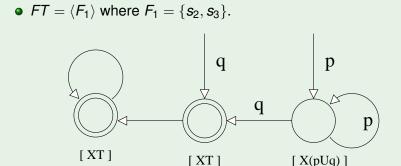

```
• Let s_1 =_{def} \langle \{p\}, \{pUq\}, \{pUq, p\} \rangle, s_2 =_{def} \langle \{q\}, \{\top\}, \{pUq, q\} \rangle,
    \mathbf{s}_3 =_{def} \langle \emptyset, \{\top\}, \{\top\} \rangle.
```

• 
$$Q = \{s_1, s_2, s_3\},$$

• 
$$Q_0 = \{s_1, s_2\},$$

• 
$$T: s_1 \to \{s_1, s_2\},$$
  
•  $s_2 \to \{s_3\}$ 

 $s_2 \rightarrow \{s_3\}$  $s_3 \to \{s_3\}$ 

54/69

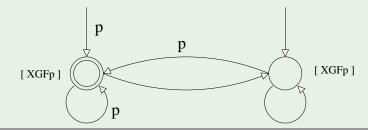

## Example: $\phi = \mathbf{GF}p$

```
\begin{aligned} &Cover(\{\mathsf{GF}p\})\\ &= E(\{\mathsf{GF}p\}, \langle \emptyset, \emptyset, \emptyset \rangle)\\ &= E(\{\mathsf{F}p\}, \langle \emptyset, \{\mathsf{GF}p\}, \{\mathsf{GF}p\} \rangle)\\ &= E(\{\}, \langle \emptyset, \{\mathsf{GF}p, \mathsf{F}p\}, \{\mathsf{GF}p, \mathsf{F}p\} \rangle) \cup E(\{p\}, \langle \{\}, \{\mathsf{GF}p\}, \{\mathsf{GF}p, \mathsf{F}p\} \rangle)\\ &= E(\{\}, \langle \emptyset, \{\mathsf{GF}p, \mathsf{F}p\}, \{\mathsf{GF}p, \mathsf{F}p\} \rangle) \cup E(\{\}, \langle \{p\}, \{\mathsf{GF}p\}, \{\mathsf{GF}p, \mathsf{F}p, p\} \rangle)\\ &= \{\langle \emptyset, \{\mathsf{GF}p, \mathsf{F}p\}, \{\mathsf{GF}p, \mathsf{F}p\} \rangle\} \cup \{\langle \{p\}, \{\mathsf{GF}p\}, \{\mathsf{GF}p, \mathsf{F}p, p\} \rangle\}\\ &\text{Note: } \mathsf{GF}p \wedge \mathsf{F}p \iff \mathsf{GF}p, \text{ s.t. } Cover(\mathsf{GF}p \wedge \mathsf{F}p) = Cover(\mathsf{GF}p) \end{aligned}
```

### Example: **GF***p*

```
• Let s_1 =_{def} \langle \{p\}, \{\mathsf{GF}p\}, \{\mathsf{GF}p, \mathsf{F}p, p\} \rangle, s_2 =_{def} \langle \emptyset, \{\mathsf{GF}p, \mathsf{F}p\}, \{\mathsf{GF}p, \mathsf{F}p\} \rangle,
```

- $Q = \{s_1, s_2\},\$
- $Q_0 = \{s_1, s_2\},$
- $\begin{array}{ccc} \bullet & T: & s_1 \to \{s_1, s_2\}, \\ & s_2 \to \{s_1, s_2\} \end{array}$
- $FT = \langle F_1 \rangle$  where  $F_1 = \{s_1\}$ .

## NBAs of disjunctions of formulas

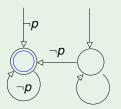

#### Remark

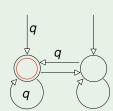

If  $\varphi \stackrel{\text{def}}{=} (\varphi_1 \vee \varphi_2)$  and  $A_{\varphi_1}, A_{\varphi_2}$  are NBAs encoding  $\varphi_1$  and  $\varphi_2$  resp., then  $\mathcal{L}(\varphi) = \mathcal{L}(\varphi_1) \cup \mathcal{L}(\varphi_2)$ , so that  $A_{\varphi} \stackrel{\text{def}}{=} A_{\varphi_1} \cup A_{\varphi_2}$  is an NBA encoding  $\varphi$ 

ullet  $A_{arphi}$  non necessarily the smallest/best NBA encoding arphi

### Example

Let  $\varphi \stackrel{\text{def}}{=} (\mathbf{GF}p \to \mathbf{GF}q)$ , i.e.,  $\varphi \equiv (\mathbf{FG} \neg p \lor \mathbf{GF}q)$ . Then  $A_{\mathbf{FG} \neg p} \cup A_{\mathbf{GF}q}$  encodes  $\varphi$ :

## Suggested Exercises:

- Find an NBA encoding:
  - p
  - $(p \land q) \lor (\neg p \land \neg q)$
  - Fp
  - **G**p
  - pRq
  - $(GFp \land GFq) \rightarrow Gr$

### **Outline**

- Büchi Automata
- 2 The Automata-Theoretic Approach to LTL Reasoning
  - General Ideas
  - Language-Emptiness Checking of Büchi Automata
  - From Kripke Models to Büchi Automata
  - From LTL Formulas to Büchi Automata
  - Complexity
- 3 Exercises

## Automata-Theoretic LTL Model Checking: Complexity

#### Four steps:

- (i) Compute  $A_M$ :  $|A_M| = O(|M|)$
- (ii) Compute  $A_{\varphi}$ :  $|A_{\varphi}| = O(2^{|\varphi|})$
- (iii) Compute the product  $A_M \times A_{\varphi}$ :  $|A_M \times A_{\varphi}| = |A_M| \cdot |A_{\varphi}| = O(|M| \cdot 2^{|\varphi|})$
- (iv) Check the emptiness of  $\mathcal{L}(A_M \times A_{\varphi})$ :  $O(|A_M \times A_{\varphi}|) = O(|M| \cdot 2^{|\varphi|})$ 
  - $\implies$  The complexity of LTL M.C. grows linearly wrt. the size of the model M and exponentially wrt. the size of the property  $\varphi$

#### **Final Remarks**

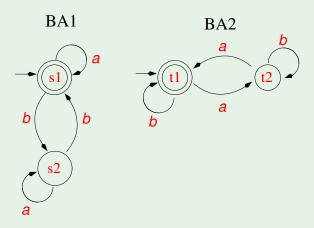

- Büchi automata are in general more expressive than LTL!
- some tools (e.g., Spin) allow specifications to be expressed directly as NBAs
- complementation of NBA important!
  - For every LTL formula, there are many possible equivalent NBAs
- → lots of research for finding "the best" conversion algorithm
  - Performing the product and checking emptiness very relevant
- ⇒ lots of techniques developed (e.g., partial order reduction)
- ⇒ lots on ongoing research

### Ex: Product of Büchi automata

Given the following two Büchi automata (doubly-circled states represent accepting states, *a*, *b* are labels):

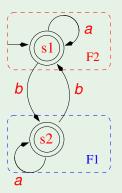

Write the product Büchi automaton  $BA1 \times BA2$ .

### Ex: Product of Büchi automata

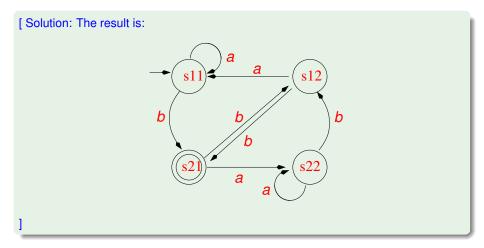

### Ex: De-generalization of Büchi Automata

Given the following generalized Büchi automaton  $A \stackrel{\text{def}}{=} \langle Q, \Sigma, \delta, I, FT \rangle$ , with two sets of accepting states  $FT \stackrel{\text{def}}{=} \{F1, F2\}$  s.t.  $F1 \stackrel{\text{def}}{=} \{s2\}, F2 \stackrel{\text{def}}{=} \{s1\}$ :

convert it into an equivalent plain Büchi automaton.

### Ex: De-generalization of Büchi Automata

### Ex: From Kripke models to Büchi automata

Given the following fair Kripke model M, convert it into an equivalent Buchi automaton. p, qF1  $\leq p, \neg q$  $p, \neg q$ [ Solution:

### Ex: Construction of Büchi Automata

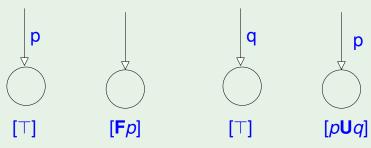

Consider the LTL formula  $\varphi \stackrel{\text{def}}{=} (\mathbf{G} \neg p) \rightarrow (p \mathbf{U} q)$ .

(a) rewrite  $\varphi$  into Negative Normal Form

[ Solution: 
$$(\mathbf{G} \neg p) \rightarrow (p\mathbf{U}q) \Longrightarrow (\neg \mathbf{G} \neg p) \lor (p\mathbf{U}q) \Longrightarrow (\mathbf{F}p) \lor (p\mathbf{U}q)$$
 ]

(b) find the initial states of a corresponding Buchi automaton (for each state, define the labels of the incoming arcs and the "next" section.)

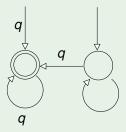

[ Solution: Applying tableaux rules we obtain:  $p \lor \mathbf{XF}p \lor q \lor (p \land \mathbf{X}(p\mathbf{U}q))$ , which is already in disjunctive normal form. This correspond to the following four initial states:

]

#### Ex: Büchi automaton

Given the following Büchi automaton BA (doubly-circled states represent accepting states):

Say which of the following sentences are true and which are false.

- (a) BA accepts all and only the paths verifying **GF**q. [Solution: false]
- (b) BA accepts all and only the paths verifying **FG**q. [Solution: true]
- (c) BA accepts only paths verifying  $\mathbf{F}q$ , but not all of them. [Solution: true]
- (d) BA accepts all the paths verifying  $\mathbf{F}q$ , but not only them. [Solution: false]
