## 1 Question

Write a $\lambda$-term $M$ implementing the following specification:

$$
M\ulcorner n\urcorner=\left\ulcorner\lambda x_{0} \ldots x_{n} \cdot x_{n} x_{n-1} \cdots x_{0}\right\urcorner
$$

(Note: The notation ${ }\ulcorner n\urcorner$ above stands for the numeral $n$, while $\ulcorner N\urcorner$ stands for $\left.{ }^{\pi} \# N\right\urcorner$ - inside LYX it's hard to tell them apart, but will appear correctly in the PDFs)
$\operatorname{Lam}\ulcorner 0\urcorner\left(\operatorname{Lam}\ulcorner n\urcorner \_F s t \_n G\left(\operatorname{Cons}(\operatorname{Var}\ulcorner n\urcorner) \_n\right)\right)$
$G=\lambda p, \operatorname{Cons}\left(A p p \_F s t(p) \_\operatorname{Var}\ulcorner\operatorname{Pred}(\operatorname{Sndp})\urcorner\right) \_(\operatorname{Predn})$
(RZ: this looks rather wrong. What about the other lambdas? Also, be careful because you don't want to use $\ulcorner-\urcorner$ here. Be more precise about where you put parenteses, many seem to be missing and/or put in the wrong places.)

### 1.1 Answer

Write your answer here.

## 2 Question

Write a $\lambda$-term $M$ which, when given as input $\ulcorner N\urcorner$, evaluates to $\ulcorner O\urcorner$, where $O$ is obtained from $N$ by replacing every syntactic occurrence of $\Omega$ with $\mathbf{I}$.

To the purpose of this exercise, assume $\Omega=\left(\lambda x_{0} \cdot x_{0} x_{0}\right)\left(\lambda x_{0} \cdot x_{0} x_{0}\right)$ and $\mathbf{I}=$ $\lambda x_{0} \cdot x_{0}$.

For example, here are some expected outputs:

$$
\begin{aligned}
& M\left\ulcorner\lambda x_{5} \cdot \Omega\right\urcorner={ }_{\beta \eta}\left\ulcorner\lambda_{5} \cdot \mathbf{x _ { 5 }} \mathbf{I}\right\urcorner \\
& M\left\ulcorner x_{3} \cdot \mathbf{K} \Omega\right\urcorner={ }_{\beta \eta}\left\ulcorner\lambda x_{3} \cdot \mathbf{K I}\right\urcorner \\
& M\left\ulcorner\lambda x_{1} \cdot x_{1} \Omega\left(\lambda x_{7} \cdot x_{1} \Omega\right)\right\urcorner={ }_{\beta \eta}\left\ulcorner\lambda x_{1} \cdot x_{1} \mathbf{I}\left(\lambda x_{7} \cdot x_{1} \mathbf{I}\right)\right\urcorner \\
& M\left\ulcorner\left(\lambda x_{0} \cdot x_{0} x_{0}\right)\left(\lambda x_{0} \cdot x_{0} x_{0}\right)\right\urcorner={ }_{\beta \eta}\ulcorner\mathbf{I}\urcorner \\
& M\left\ulcorner\left(\lambda x_{1} \cdot x_{1} x_{1}\right)\left(\lambda x_{1} \cdot x_{1} x_{1}\right)\right\urcorner={ }_{\beta \eta}\left\ulcorner\left(\lambda x_{1} \cdot x_{1} x_{1}\right)\left(\lambda x_{1} \cdot x_{1} x_{1}\right)\right\urcorner
\end{aligned}
$$

Hint: use Sd, etc. as approprate.

### 2.1 Answer

$$
\begin{aligned}
\ulcorner \# \Omega\urcorner & =449 \\
M & =\Theta\left(\lambda g \cdot x \cdot E q \_x \_\ulcorner 449\urcorner\ulcorner I\urcorner\left(S d \_x_{-} V_{-} A_{-} L\right)\right) \\
V & =\lambda i \cdot V a r \_i \\
A & =\lambda p \cdot q \cdot A_{p p}(g p) \_(g q) \\
L & =\lambda i . n \cdot L_{1} m_{-} i \_(g n)
\end{aligned}
$$
